

# Item images are not showing up after importing it from the csv file.

## Problem:

The CSV file is export of item master data from DB1 which i wanted to import to another db - DB2. Import is done successfully and copied all the image files from site1 to site2. however the images are not showing up in the site. All the paths and image names are specified correctly.

## Solution:

In the standard data export template we are not getting **image** column instead, it is populating only **website\_image** column. Whereas, in the site the images are fetching and displaying from the **image** column to display the images.

So we must either add a image column in the csv file and copy the file path or you need to run an update command after the importing is done, `update db_name.tabitem set tabitem.image=tabitem.website_image where 1=1`
